23/03/2021

First presentation of my data set

I wanted to find something related to Covid-19 but looking at something positive. I found data from WHO on cases of influenza as I have heard from many places that people haven't got flu or colds as they usually would due to social distancing.

I have processed the data to just look at the total cases of all types of flu on a weekly basis. From initially looking at the data, it does look like the cases in 2020/2021 are a lot lower.

```
df <- read.csv(here("data", "rawfludata.csv"))

df <- df %>%
  rename(year = Year, week = Week, start = Start.date, end = End.date, cases = Total.number.of.influenza.cases)

df <- df %>%
  select(year, week, start, end, cases)

head(df)
```

##	year	week	start	end	cases
## 1	2015	1	2014-12-29	2015-01-04	315
## 2	2015	2	2015-01-05	2015-01-11	387
## 3	2015	3	2015-01-12	2015-01-18	343
## 4	2015	4	2015-01-19	2015-01-25	415
## 5	2015	5	2015-01-26	2015-02-01	442
## 6	2015	6	2015-02-02	2015-02-08	452
